Outline

- Background
- RSR Comparison
- Methodology
- Cross-calibration Results
- Summary

Need for cross-calibration

- The ability to detect and quantify changes in the Earth's environment depends on sensors that can provide calibrated, consistent measurements of the Earth's surface features through time
- A critical step in this process is to put image data from different sensors onto a common radiometric scale
- The cross-calibration techniques use a well-calibrated sensor as a form of transfer radiometer to achieve characterization of other sensors using near-simultaneous observations of the Earth
 - ◆ Cross-calibration is the only viable solution to tie similar sensors (TM) and differing sensors (TM-ETM+) onto a common radiometric scale, thus providing an important role in **mission continuity, interoperability, and data fusion**
 - ◆ Cross-calibration is useful in situations where on-board references are not available or where vicarious calibration is not feasible
 - ◆ Cross-calibration between sensors is critical to coordinate observations from different sensors, exploiting their individual spatial resolutions, temporal sampling, and information content to monitor surface processes over broad scales in both time and space

Multi-Sensor Solutions (MSS) Architecture

- Increasingly, data from multiple sensors are used to gain a more complete understanding of land surface processes at a variety of scales
- The success of MSS architecture depends on how well the contributed sensors achieve **“Interoperability”**
- Here, interoperability is that condition wherein differences among systems are not a barrier to a task that spans those sensors
- The focus is on how sensors work together
- The MSS architecture should provide the specifications of just those “few things that must be similar”

- **Interoperability Arrangements – “What few things must be the same so that everything else can be different?”**

Eliot Christian

Sensor Overview

Platform	Terra	Landsat 7	IRS-P6
Sensor	MODIS	ETM+	AWiFS
Number of bands	36	8	4
Spatial resolution	250 m, 500 m, 1 km	15 m, 30 m, 60 m	56 m (near nadir), 70 m (near edge)
Swath	2360 km	187 km	740 km
Spectral coverage	0.4~14 μm	0.4~12.5 μm	0.52~1.7 μm
Pixel quantization	12 bit	8 bit	10 bit
Launch date	Dec 18, 1999	Apr 15, 1999	Oct 17, 2003
Orbit type	Sun synchronous	Sun synchronous	Sun synchronous
Altitude	705 km	705 km	817 km

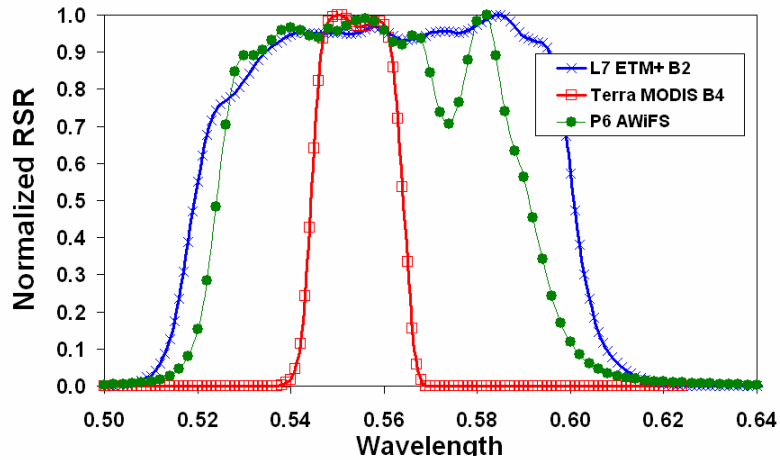

Normalized Relative Spectral Responses (RSR)

Spectral Band Comparison

L7 ETM+ (B2), Terra MODIS (B4), P6 AWiFS (B2)

L7 ETM+ (B3), Terra MODIS (B1), P6 AWiFS (B3)

L7 ETM+ (B4), Terra MODIS (B2), P6 AWiFS (B4)

L7 ETM+ (B5), Terra MODIS (B6), P6 AWiFS (B5)

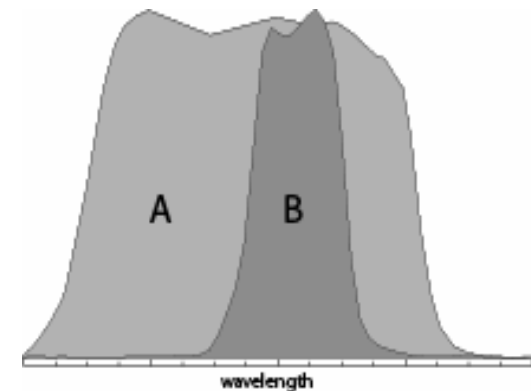

Figure of Merit (alpha)

- The Figure of Merit ("alpha") is defined as the intersecting areas of two spectral response functions divided by the union of the two areas
 - ◆ alpha = 1.0 indicates complete spectral agreement between two bands
 - ◆ alpha = 0.0 indicates complete disagreement

$$\alpha = \frac{A \cap B}{A \cup B}$$

where A & B represent the areas under the RSR curves

- The figure of merit approach is plagued by the lack of spectral scene content information, but at least provides a non-unity factor
 - ◆ For a spectrally flat scene, the RSR differences will not matter
- The figure of merit can be viewed more as a quantization of 'potential' differences in cross-cal between the sensors

Spectral Band Comparison

L7 ETM+			Terra MODIS			IRS-P6 AWiFS		
Band	(μm)	Res.(m)	Band	(μm)	Res.(m)	Band	(μm)	Res.(m)

Test Site Catalog

[Catalog of World-wide Test Sites for Sensor Characterization](#)

In an era when the number of Earth-observing satellites is rapidly growing and measurements from these sensors are used to answer increasingly urgent global issues, it is imperative that scientists and decision makers rely on the accuracy of Earth-observing data products. The characterization and calibration of these sensors are vital to achieve an integrated Global Earth Observation System of Systems (GEOSS) for coordinated and sustained observations of Earth. The U.S. Geological Survey (USGS), as a supporting member of the Committee on Earth Observation Satellites (CEOS) and GEOSS, worked with partners around the world to establish an online Catalog of prime candidate worldwide test sites for the post launch characterization and calibration of space-based optical imaging sensors. The online Catalog provides easy public Web site access to this vital information for the global community. Through greater access to and understanding of these vital test sites and their use, the validity and utility of information gained from Earth remote sensing will continue to improve.

[View Additional Photos](#)

Purpose:	Radiometric, vicarious calibration test site with large homogeneous regions
Description:	Dry-lake playa, spatially homogeneous, consisting of compacted clay-rich lacustrine deposits forming a relatively smooth surface compared to most land covers, although it has a lower spatial uniformity compared to the Ivanpah and Lunar Lake sites. The surface composition is comparable to those of Ivanpah and Lunar Lake. However, all three sites suffer from the presence of iron absorption (Fe2+) in the visible part of the spectrum, characteristic of playas in this region of the United States.
	Google Earth: Slightly patchy (in color and intensity) across the playa.
Support Data:	Strong linear road features and oil drilling structures (no lat/long available)
Suitability:	Recommended for 15-m GSD and larger, Visible/UV to SWIR. Solar reflective and emissive, submeter to 2-km GSD
Limitations:	Soft surface composition, spatial and spectral variation, possible hot spot effects, periodic snow and water, cloud cover increases in winter, remote location for ground-based studies

Test Sites (Libya 4 & RVPN)

- Location (City, State, Country): Libya, Africa
- Altitude above sea level (meters): 118
- Center Latitude, Longitude (Degrees): +28.55 , +23.39
- Landsat WRS-2 Path/Row: 181 / 40
- High reflectance in visible bands
- Large sand dunes with no vegetation
- Used extensively for long-term stability monitoring

- Location (City, State, Country): Ely, Nevada, USA
- Altitude above sea level (meters): 1435
- Center Latitude, Longitude (Degrees): +38.5 , -115.69
- Landsat WRS-2 Path/Row: 40 / 33
- Used extensively for field campaigns

ETM+ Bands: 321 Zoomed

Image Pairs Selection Criteria

- Near-simultaneous pairs (within 30 min)
- Repeat Cycle in days
 - ◆ ETM+ (16), MODIS (1) AWiFS (5)
- Cloud free
- ROI is close to nadir angle for MODIS & ETM+

AWiFS

MODIS

ETM+

Libya 4 Test Site

MODIS

ETM+

RVPN Test Site

Methodology

- Each sensor is well-characterized radiometrically & geometrically
- Co-located areas identified for each image pairs
- At-sensor radiance (W/m²/sr/μm) and at-sensor reflectance [0,1] were computed for all scenes
- Linear fits, average percent differences and RMSE's computed for each band

$$\rho_p = \frac{\Pi \cdot L_\lambda \cdot d^2}{ESUN_\lambda \cdot \cos \theta_s}$$

ρ_p =unitless planetary reflectance
 L_λ =spectral radiance at the sensor's aperture
 d =Earth-Sun distance in astronomical units
 $ESUN_\lambda$ =Solar exoatmospheric mean irradiances
 θ_s =solar zenith angle in degrees

Exoatmospheric Solar Spectral Irradiances					
ESUN UNITS = W/m ² μm					
ETM+ (CHKUR)		MODIS (WRC)		AWiFS (CHKUR)	
1	1969	3	2015.1		
2	1840	4	1859.1	2	1849.82
3	1551	1	1606.1	3	1579.37
4	1044	2	991.72	4	1075.11
5	225.7	6	239.63	5	235.83
7	82.07	7	89.385		

Results

- Scene standard deviation bars are added
- Linear equations are fitted
 - ◆ Slope values are very small
 - ◆ There are constant offsets
- The annual oscillation were caused by BRDF effect
- The slope values prove the long term stability of the two sensors
- The residue standard deviation values are within the 2% of radiometric specifications

Summary and Future Work

- **A long-term radiometric stability evaluation between Terra MODIS and L7 ETM+ was performed using near-simultaneous scene pairs over the uniform Libyan 4 (56 image pairs) desert target and RVPN (78 image pairs) covering the lifetime of the two sensors**
- **ETM+ and MODIS sensors showed excellent long-term TOA reflectance stability generally within 2%**
 - ◆ Results are consistent between Libya 4 and RVPN sites
- **Results from AWiFS sensors show short term stability**
 - ◆ Need to monitor the long term trends & absolute calibration
- **ISRO should acquire and archive imagery over five top tier sites!**
 - ◆ Get access to AWiFS data from NRSA & ASRC archive
- **Additional work is underway to characterize the uncertainties due to spectral mismatches, spatial, BRDF, and atmospheric impacts**
